

[What Is Process Addiction](#)

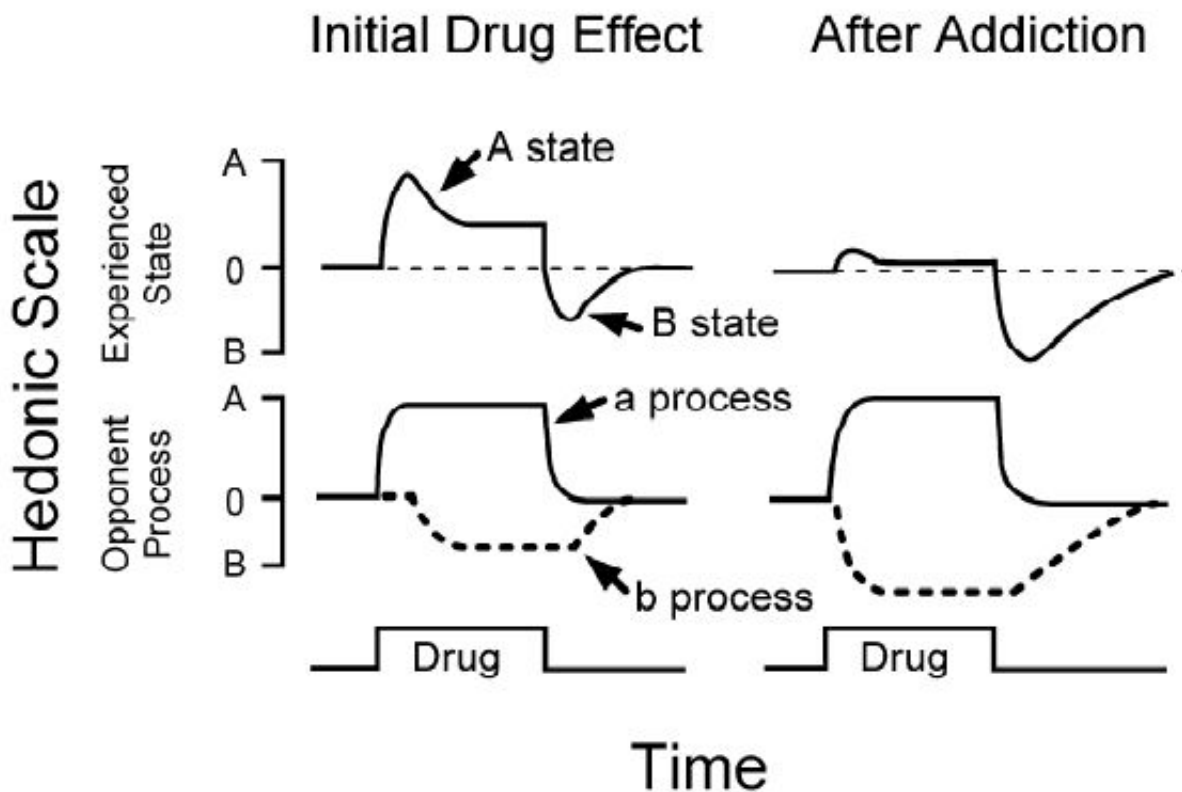

Figure 1 Opponent process model of addiction. According to the opponent process theory the affective (hedonic or emotional) response to a stimulus (a drug in this case) is the underlying a-process, which in turn elicits the opponent b-process (*bottom*). The underlying processes add together to cause the initial pleasant A-state, which is actually experienced, followed by an opponent unpleasant B-state. Initially the pleasant A-state is large, followed by a small B-state. With repeated drug use and in addiction, however, the opponent b-process increases in magnitude and duration, leading to an experience dominated by the unpleasant symptoms associated with withdrawal. (Adapted from Solomon 1977 and Solomon & Corbit 1973.)
